Models

Load in Clean Data

```
atp_final <- read.csv("C:/Users/timst/Documents/SMU/Fall_2022/STAT6341/Project/Tennis_Data_Reduced/2015-
                                                  header =T)
```

Given that the data has underwent cleaning, feature processing, and wrangling, I want to build some classification models.

Model 1: Logistic Regression
